1 HTML Forms

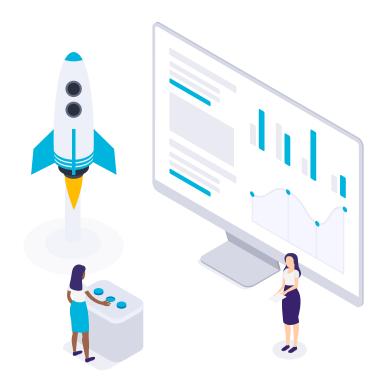

HTML Forms

- Submission to a server
- Collection of elements inside
 <form></form> tags.
- At least one input element of type="submit".
- action: The resource/URL where to send the form-data when the form is submitted.
- method: The HTTP method used to send the data: POST or GET

```
<form action="/send to this url/" method="">
   <label for="id_firstname">Firstname:</label>
   <input id="id_firstname" type="text" name="firstname"> <br>
   <label for="id lastname">Lastname:</label>
   <input id="id_lastname" type="text" name="lastname"> <br>
   <input type="submit" value="OK">
 </form>
</body>
                    127.0.0.1:8000/fscohort/tmp/
                          YouTube
                                          Online Course
Firstname:
Lastname:
 OK
```

2 Django Forms

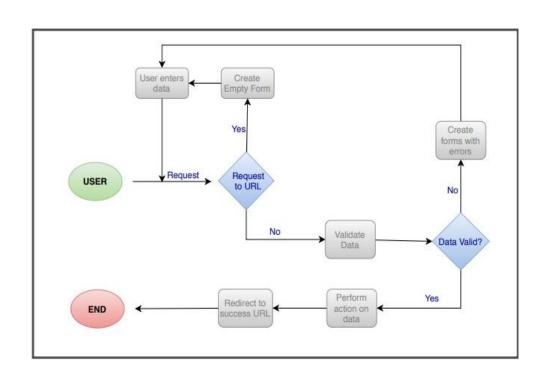

Django Forms

 preparing and restructuring data to make it ready for rendering

creating HTML forms for the data

 receiving and processing submitted forms and data from the client

Form Class

```
1 from django import forms
                                                                               Argument
  3 - class StudentForm(forms.Form):
         first_name = forms.CharField(max_length=100, label="Your Name")
         last name = forms.CharField(max length=100, label="Your Surname")
         number = forms.IntegerField(required=False)
  6
Fields
                   Field Type
```

Django Forms

ModelForms

```
from django import forms
                                                                Model
from .models import Student
                                                                Name
class StudentForm(forms.ModelForm):
    class Meta:
         model = Student
         fields = ["first_name", "last_name", "number"
           model fields to render on the form.
```

THANKS! > 1

Any questions?

```
from django.db import models
from orders.models import Order
class Sale (models.Model):
   order = models.ForeignKey(Order, on delete=models.CASCADE)
   amount = models.PositiveIntegerField(blank=True, null=True)
   def str (self):
       return str(self.amount)
```
